                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    383
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sasaki, National Institute of Agrobiological Resources, Rice Genome Research Program, Kannondai 2-1-2, Tsukuba, Ibaraki 305-8602, Japan (E-mail:tasaski@abr.affrc.go.jp, URL:http://www.dna.affrc.go.jp:82/, Tel:81-298-38-7441, Fax:81-298-38-7468)
The orientation of the sequence is from T7 to SP6 of the PAC clone. Genes were predicted from the integrated results of the following:GENSCANI.0, BLASTNZ.0, BLASTNZ.0 as well as SplicePredictor (October 1998 version). The genomic sequence was searched against the non-redundant database NRP (PIR, SWISSPROT, GENPEPP, PDB) from MAFF DNA bank and the cDNA sequence database at RGP. Protein similarities of the cording regions were searched against NRP with BLASTP2.0. ESTs represent the identified cDNA sequences using BLASTN 2.0 with the corresponding DDBJ accession
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tcagtttggatctgtacaacaacaatctcaccgggaaaatcccatcttctttgggaaaat 442

Production of apomictic seeds - useful in plant
Claim 28; Pages 86-88; 123pp; English.
The sequence is that of an EST clone showing hi
SERK LRR (leucine-rich repeat) sequences.
                                                                                                                                                 V06590 standard; cDNA to mRNA; 1063 BP. V06590; 03-AUG-1998 (first entry) Arabidopsis thaliana SERK LRR homologous receptor kinase; apomixis; apomictic; see plant breeding; leucine-rich repeat; ss. Arabidopsis thaliana.

                                                                                                                                        plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated.

Apomixis allows plant breeders to develop cultivars with seed and forage quality and maturity.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising; (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing the transformed material into plants or carpel-containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Daucus carota SERK gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA encoding plant morphogenesis regulatory protein - useful to yield plants with short stems or altered inflorescence Claim 1; Pages 6-10; 17pp; Japanese.

The present sequence encodes an Arabidopsis thaliana plant morphogenesis regulatory protein (MRP), which can be used to yiel a plant with, e.g. short stems or altered inflorescence. The MRP cacts on a plant at a specific site for a specific period, and can therefore be used to regulate extraneous gene expression in a plant. The MRP's cDNA or genomic DNA can be used to transform a plant to increase its MRP expression, and therefore control the form (particularly stem length) of the plant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 멼
                 Production of apomictic seeds - useful in plant breeding Claim 26; Pages 64-67; 123pp; English.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the

Apomixis allows plant breeders to develop cultivars with specific stable traits for such characteristics as height, seed and forage quality and maturity.

Sequence 4081 BP; 1120 A; 770 C; 785 G; 1406 T;
T06307 is a tomato pathogen resisitance gene Cf-2.2 partial cDNA clone. In a new method this gene is expressed highly in genetic constructs which may be used to impart a broad range of pathogen resistance, by induction of variegation, to transgenic plants (or parts or propagales of plants) containing such constructs. Cf-2.2 imparts resistance to the disease caused by the leaf mould fungal pathogen Cladosporium fulvum. C.fulvum containing avirulence (Avr) genes that confer recognition by plants containing Cf-genes, leading to the activation of host defence mechanisms to attack the disease.

                                               Increasing plant pathogen resistance by induction of variegation—may lead to acquired resistance to a broad range of pathogens.

Claim 9; Page 80-83; 131pp; English.

T06306 is the tomato pathogen resistance gene Cf-2.1. In a new method this gene is expressed highly in genetic constructs which may be used to impart a broad range of pathogen resistance, by induction of variegation, to transgenic plants (or parts or propagules of plants) containing such constructs. Cf-2.1 imparts resistance to the disease caused by the leaf mould fungal pathogen Cladosporium fulum.

C. fulvum contains avirulence (Avr) genes that confer recognition by plants containing Cf-genes, leading to the activation of host defence mechanisms to attack the disease.

                                                                                 PT Tomato gene Cf-5, confers resistance to Cladosporium fulvum - useful production of transgenic plants resistant to pathogens e.g. for production of transgenic plants resistant to pathogens e.g. production of transgenic plants resistant to pathogens e.g. for production of transgenic plants. The polynucleotide of the invention, which cfic can be produced by incorporating the gene variants, which offer cresistance against the pathogen Cladosporium fulvum-5. Transgenic plants can be produced by incorporating the gene into plant cells and coffspring can also be subsequently produced. Expression of the gene in complementary to the gene or fragments with sequences complementary to the gene or fragments of it, are useful in anti-sense techniques to reduce gene expression. The nucleic acids/polynucleotides care useful as hybridisation probes to identify other genesty resistance in potentions. Homologies between Cf-5 and Cf-9 may be used to identify continues of this class.

Production of apomictic seeds - useiu....

Claim 21; Pages 40-46; 123pp; English.

Claim 21; Pages 40-46; 123pp; English.

The sequence is that encoding SERK, a putative receptor kinase.

It may be used as part of a method of producing apomictic seeds of morising: (a) transforming plant material with a nucleotide composition; (a) transforming plant material with a cell or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed propagated hybrids and could shorten and simplify the breeding process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated.

Apomixis allows plant breeders to develop cultivars with specific stable traits for such characteristics as height, seed and forage quality and maturity.

Seed and forage quality and maturity.
This sequence is an example of the polynucleotide of the invention, and is able to confer pathogen resistance on a plant. It is one of two tomato CF-5 gene variants, which offer resistance against the pathogen resistance against the pathogen resistance against the pathogen confer pathogen plants can be produced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced by incorporating conferenced conferenced by incorporating conferenced conferenced conferenced complete conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferenced conferen

Promato gene Cf-5, confers resistance to Cladosporium fulvum - useful production of transgenic plants resistant to pathogens e.g.

Production of transgenic plants resistant to pathogens e.g.

Production of transgenic plants resistant to pathogens e.g.

Claim 6; Fig 1b; 75pp; English.

CC This sequence is an example of the polynucleotide of the invention, and confer pathogen resistance on a plant. It is one of two tomato confer pathogen resistance against the pathogen confer pathogen resistance against the pathogen confer pathogen confer plants can be produced by incorporating the gene into plant cells and regenerating plants from the cells; confered the gene into plant ells and regenerating can also be subsequently consequently produced offspring can also be subsequently confered to the gene of the gene in plant cells can confer pathogen configuration of the gene of fragments configuration to the gene or fragments configuration of the gene of fragments confered to reduce gene expression. The nucleic acids/polynucleotides are useful as hybridisation probes to configurate to the gene of plants cells can confered to the gene of fragments conferring pathogen resistance on plants cell fragments conferring pathogen resistance on plants cells and resistance on plants cells and cells and cells and cells and cells and cells can confered to the gene of the cells can confered to the cells can cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confered to the cells can confere
